### DLFA - Cohort 6 Module 5 – To Classify Tones of Musical Emotion Files (Speech And Audio Processing)

#### Team Creation and Prediction Submission in Kaggle

1. If you do not have an account with Kaggle, you can use your google account to **sign in** to Kaggle or create one for yourself or one on behalf of your team comprising four to five members.
2. Go to this in-class Kaggle Competition (<https://www.kaggle.com/t/c8bda808fac2419d8025370763a90ada>) and **accept the rules** under the “Rules” tab

3. You can see the train and test set from the Data section. We are providing a Colab Notebook ([https://drive.google.com/file/d/1otVnXZruvtyoQjpCATOe5sosuyF1S6\\_7/view?usp=sharing](https://drive.google.com/file/d/1otVnXZruvtyoQjpCATOe5sosuyF1S6_7/view?usp=sharing)) which contains the instructions for downloading the train and test data. However, the train, test data and submission files can be downloaded from Kaggle also, but we recommend downloading train data, test data and sample submission file by executing cells in the Colab Notebook.

You will obtain:

- A. Train directory that contains 1873 audio files (.wav format) selected from each of 2 classes (Happy or Sad).
- B. Test directory that contains 253 audio files (.wav format) selected from each of 2 classes (Happy or Sad).
- C. sample\_submission.csv, which is a template for submission or predictions.

Note:

- I. File name format is 1.wav (number before .jpg is the Id of the file corresponding to the submission sequence. Do follow the order 1,...,253 while making predictions in the csv file).
  - II. sample\_submission.csv, which is a template for submission or predictions.
- 
4. Extract features of test dataset samples and get predictions using the pre-trained models of CNNs or your own version of the CNN code written in Python (decode the labels to sync with sample\_submissions.csv)

5. sample\_submission.csv contains the format and header File Name and Target). Prepare your predictions in sample\_submissions.csv format. Submit it by clicking on the Submit predictions tab as shown below.

6. After successful submission, you will see the Categorization Accuracy Score generated and an updated leaderboard position. The test set is split into a public set (80%) and a private set (20%). All your submissions are evaluated on both parts of the test set. By default we take your best submission on the public set for rankings. The public leaderboard is the ranking of all participants' submissions on the public set. It is actualized after every submission. The private leaderboard is the rankings of participant's submission on the private set, it is hidden from you and used for evaluation.

- The public leaderboard position will be updated as you submit the best predictions. The scores of the different teams will be displayed in real-time on the public leaderboard.
- The final score is calculated on the private leaderboard.
- Maximum 20 submissions are allowed per day (IST time) per team
- The public leaderboard will be active till 11:59 PM, 13th July 2024, IST

- The private leaderboard will be visible after 11:59 PM, 14th July 2024, IST

**Note**: Please ignore the first entry on the leaderboard.
