DLFA - Cohort 6 Module 4 – To Classify Coronavirus Tweets During Covid-19 (Natural Language Processing)

Team Creation and Prediction Submission in Kaggle

1. If you do not have an account with Kaggle, you can use your google account to **sign in** to Kaggle or create one for yourself or one on behalf of your team comprising four to five members.
2. Go to this in-class Kaggle Competition (<https://www.kaggle.com/t/15cef0def403469ebbb5db1a67991873>) and **accept the rules** under the “Rules” tab

3. You can see the train and test set from the Data section. We are providing a Colab Notebook (https://colab.research.google.com/drive/1faalVqBKChCTQag8GXtluHG rzZ_mno6D?usp=sharing) which contains the instructions for downloading the train and test data. However, the train, test data and submission files can be downloaded from Kaggle also, but we recommend downloading train data, test data and sample submission file by executing cells in the Colab Notebook.

You will obtain:

- A. corora_nlp_train.csv directory that contains 36000 tweets selected from each of 5 classes.
- B. corona_nlp_test.csv directory that contains 8955 tweets selected from each of 5 classes.
- C. sample_submission.csv, which is a template for submission or predictions.

Note: Do follow the order 1,...,8955 while making predictions in the sample_submission.csv file).

4. Extract features of train and test dataset samples and get predictions using the Convolutional Neural Networks or Recurrent Neural Networks (LSTMs or GRUs or BERTs) code written in Python (predict the results to sync with sample_submissions.csv)

5. sample_submission.csv contains the format and header (Test_Id and Sentiment). Prepare your predictions in sample_submissions.csv format. Submit it by clicking on the Submit predictions tab as shown below.

6. After successful submission, you will see the Categorization Accuracy Score generated and an updated leaderboard position. The test set is split into a public set (80%) and a private set (20%). All your submissions are evaluated on both parts of the test set. By default we take your best submission on the public set for rankings. The public leaderboard is the ranking of all participants' submissions on the public set. It is actualized after every submission. The private leaderboard is the rankings of participant's submission on the private set, it is hidden from you and used for evaluation.

- The public leaderboard position will be updated as you submit the best predictions. The scores of the different teams will be displayed in real-time on the public leaderboard.
- The final score is calculated on the private leaderboard.
- Maximum 20 submissions are allowed per day (IST time) per team

- The public leaderboard will be active till 11:59 PM, 23rd November 2024, IST
- The private leaderboard will be visible after 11:59 PM, 24th November 2024, IST

Note: Please ignore the first entry on the leaderboard.
